Recent progress in our understanding of the molecular biology of cancer and of the specific roles of endothelial cells and vascular structures in normal physiology has provided new targets for anticancer therapy. The vascular endothelium regulates blood flow and coagulation in normal tissues and is a major component of the hematopoietic bone marrow

microenvironment. Tumors induce remodeling of the tumor vasculature, to facilitate their rapid expansion. The angiogenic switch is a key step in tumor progression, and is now being exploited as a target for therapy. Inhibition of tumor angiogenesis results in vascular shutdown, tumor hypoxia, and selection for angiogenesis-independent tumor cell lines. Various strategies to inhibit angiogenesis are being explored, including the use of growth factors or other signal transduction inhibitors to prevent activation of endothelial cells, agents to inhibit cell surface adhesion receptors, agents to inhibit the endothelial cell basement membrane, and cytotoxic agents that target the endothelial cell. The challenge is to develop safe and effective therapeutic regimens to target angiogenesis.

Q: Reasons to use Test Driven Development (TDD) vs Traditional Unit Testing I'm trying to wrap my head around the differences between Test Driven Development and traditional unit testing. I'm a bit new to TDD so any explanations that help make it clear would be greatly appreciated. I'm also using C#, but this question applies to any language. What are the reasons one would use TDD versus traditional unit testing? A: I'd say TDD makes unit tests more flexible. And generally more useful. As opposed to

traditional unit tests, TDD tests aren't tied to a specific set of classes or methods. This makes it easier to write tests. It also makes it easier to write tests that aren't tied to a particular class, because it's all or nothing - there are no parameters to start. A: TDD is about writing a test first, so it doesn't matter if it tests a class or a
